

Signhify – Implementation Roadmap to the Final Vision

Vision: Signhify is the first AI-native product studio operating system — where any founder describes an idea and a swarm of AI agents (steered by humans) ships a real, revenue-ready product end-to-end.

This is the public, living plan we are executing against. Each week has a clear exit criterion. We ship the visible surface first, then the agent fabric behind it.

Week 1 – Studio Foundation (NOW)

Exit: A cinematic studio site that converts visitors into briefed leads.

- Immersive 3D hero (Three.js ember field)
- Bento `/projects` gallery + dedicated `/projects/:slug` pages (SEO + share)
- `/contact` wizard → `leads` table in Supabase (server function, RLS hardened)
- `/book` Calendly embed + WhatsApp floating action (+91 62024 42690)
- `/privacy` , `/terms` , `/roadmap` legal & transparency surfaces
- `llms.txt` , sitemap.xml, OG/Twitter cards across every route

Week 2 – Signhify AI Preview

Exit: Anyone can prompt the live `/ai` page and get a real Claude-generated build plan, with their email captured for early access.

- `/ai` wired to Claude via Lovable AI Gateway (server function, no key in browser)
- Six-agent UI pipeline animated by real backend stages
- `waitlist` table + form, double-opt-in email via Resend

- Rate-limit + abuse guard (per-IP token bucket)
- Streaming responses (SSE) for sub-second perceived latency

Week 3 – Ecosystem Nav & Marketplace v0

Exit: A logged-out visitor can browse the ecosystem (`studio` , `ai` , `marketplace` , `cloud` , `os` , `deploy`) and download one free template.

- Universal ecosystem switcher in header
- `/marketplace` with Supabase-backed listings, Stripe checkout in test mode
- Asset delivery via signed URLs from Supabase Storage
- Creator console stub at `/marketplace/sell`

Week 4 – Signhify Cloud (Beta Auth + Project Spaces)

Exit: Authenticated users get a personal `/app` workspace listing their AI-generated projects.

- Supabase Auth (email + Google OAuth via Lovable broker)
- `_authenticated/` route gate, `app` schema with `projects` , `runs` , `artifacts`
- One-click export to GitHub repo
- Realtime build log viewer (`postgres_changes`)

Week 5 – Signhify OS (Agent Orchestration Layer)

Exit: A single prompt triggers a multi-agent run that produces a working Lovable project, persisted under the user's account.

- Agent runtime in TanStack server functions, calling Anthropic + tool-use
- Tool catalog: code-gen, design-token-emit, schema-design, deploy-trigger
- Cost & latency budget enforced per run; 402/429 surfaced as inline UI
- Replay viewer at `/runs/:id`

Week 6 – Signhify Deploy (One-Click Hosting)

Exit: A finished agent run can be deployed to a `*.signhify.app` subdomain in under 60 seconds.

- Cloudflare Workers + Pages integration
- Custom domain wizard + automated DNS verification
- Per-project analytics (page views, Core Web Vitals)
- Production secrets vault (per-project, AES-256 at rest)

Week 7-8 – Polish, Pricing & Public Launch

Exit: Signhify is generally available with a public pricing page, transparent SLA, and 100 paying design partners.

- Stripe (annual + monthly), credit-pack add-ons
- Status page (`status.signhify.online`)
- Help docs (`docs.signhify.online`) auto-generated from internal markdown
- Launch sequence: Product Hunt, X, LinkedIn, Indian tech press

North-Star Metrics (2026)

Metric	Target
Prompts → live deploys	10,000
Paying design partners	1,000
Average prompt → preview	< 90s
Free-to-paid conversion	8%
NPS	≥ 60

Operating Principles

1. **Ship the surface first, then the fabric.** Visible wins build the brand that funds the engine.
2. **Every route is a product.** SEO, OG image, schema.org JSON-LD, real metadata — never an afterthought.
3. **Servers, not browsers, hold the keys.** All AI + DB work runs in TanStack server functions.

4. Public roadmap, private execution. This document updates publicly; the runway behind it is ours to defend.
